

RestroPOS: UI/UX Design System

This document explains the aesthetics, colors, typography tokens, and design choices used to build the premium RestroPOS user interface.

1. The Design Aesthetic: Cabernet Dark Mode

RestroPOS does not look like a generic, plain Excel spreadsheet. It utilizes a **vibrant, high-contrast dark theme** modeled after luxury restaurant environments (warm candlelight, deep reds, slate tables):

- **Core Background:** Pure obsidian black (#000000) and dark slate grey (#0a0a0a / #111111) to prevent eye fatigue for staff working long, low-light dinner shifts.
- **Accents & Highlights:** Warm restaurant amber/orange (#f97316 / Tailwind's orange-500) used sparingly for action items, active buttons, and notifications.
- **Visual Dividers:** Super-subtle semi-transparent white borders (border-white/[0.06]) instead of harsh solid grey lines.

2. Typography Hierarchy

Consistent typography is maintained across all pages using Google Fonts:

- **Heading Font (Outfit):** A modern, geometric sans-serif font with rounded details. Used for branding logos, dashboard headers, and major product sections.
- **Body & Data Font (Inter):** A clean, highly legible neo-grotesque sans-serif. Used for numbers, ticket calculations, order lists, and general settings. It has excellent numerical alignment to prevent column layout breaks.

3. Glassmorphism & Depth

To make cards and layouts feel layered and premium, we use glassmorphism:

- **Card Styling:** Cards are styled with:

```
background: rgba(255, 255, 255, 0.04);
border: 1px solid rgba(255, 255, 255, 0.06);
backdrop-filter: blur(12px);
```

- **Layering:** Active layers (like the sidebar or cart drawers) use a slightly lighter slate background (`var(--bg-1)`) to establish a clear spatial hierarchy.

4. Micro-Animations & Responsiveness

An interface that feels responsive and alive encourages faster usage:

- **State Hover Effects:** Interactive buttons and links smoothly transition their background color and text opacity using:

```
transition: all 150ms cubic-bezier(0.4, 0, 0.2, 1);
```

- **Live Simulator Spinners:** Active operations (like loading database entries or generating a live order simulation) use a rotating spinner to let users know the system is executing in the background.
- **Card Scale-Ups:** Onboarding packages and menu choices scale up slightly (`hover:scale-[1.01]`) to draw focus.
